

FUNDAMENTALS OF HTML

OVERVIEW:

1. INTRODUCTION TO HTML
2. WHAT IS HTML
3. THE BIRTH OF HTML
4. HTML EVOLUTION
5. HTML STANDARDS

INTRODUCTION TO HTML

WHAT IS HTML?

HTML is like **the skeleton of a website**, giving it structure and form. It sets up everything you see online, from text and images to forms and buttons. Without HTML, websites would just be plain text without any organization.

WHAT IS HTML?

HTML = HyperText Markup Language

- **Hypertext** refers to **text that contains links to other documents or resources**. In HTML, hypertext allows users to navigate between different web pages by clicking on links.

- **Markup** refers to the **annotations or tags** that are used to define the structure and formatting of content in a document. In HTML, markup tags are used to specify elements such as headings, paragraphs, images, and links that make a web page visually appealing and easy to navigate. These tags provide information to web browsers about how the content should be structured, styled, and rendered on the user's screen.

WHAT IS HTML?

Language refers to the **system of rules and syntax used to write and interpret the markup** in a consistent and standardized manner. HTML provides a set of predefined tags and attributes that define how content should be displayed and interacted with in a web browser. It's the universal translator, the language that humans, computers and browsers understand.

THE BIRTH OF HTML

- It all started back in 1989 when Tim Berners-Lee invented HTML while working at CERN, the European Organization for Nuclear Research. His vision was to create a way to share scientific information easily across different computers.
- The first web page, created by Tim Berners-Lee, was a simple yet groundbreaking creation. It consisted of plain text and hyperlinks that allowed users to navigate and explore different documents and resources.

THE BIRTH OF HTML

- The first version of HTML, called **HTML 1.0**, was released in 1993. It was a simple markup language with limited features compared to the modern versions we use today.
- Over the years, HTML has evolved and new versions have been introduced, each bringing new **elements**, **attributes**, and **features** to enhance the capabilities of web development.
- **HTML 5**, the current version, was released in **2014** and introduced many exciting features such as native multimedia support, semantic elements, and improved form controls.

HTML EVOLUTION

- **Introduction of HTML1 (1993)**
  The first version of HTML that laid the foundation for web development. It introduced basic elements like headings, paragraphs, and lists, paving the way for the future of HTML.
- **Introduction of HTML2 (1995)**
  With HTML2, tables and the ability to embed images were introduced. This made it easier to create structured layouts and include visuals in web pages.
- **HTML3 and HTML4 (1997)**
  HTML3 (1997) brought exciting features like frames, style sheets, and the ability to add interactivity with JavaScript. HTML4 (1997, republished in 1999) continued to build on those advancements and introduced support for multimedia elements.

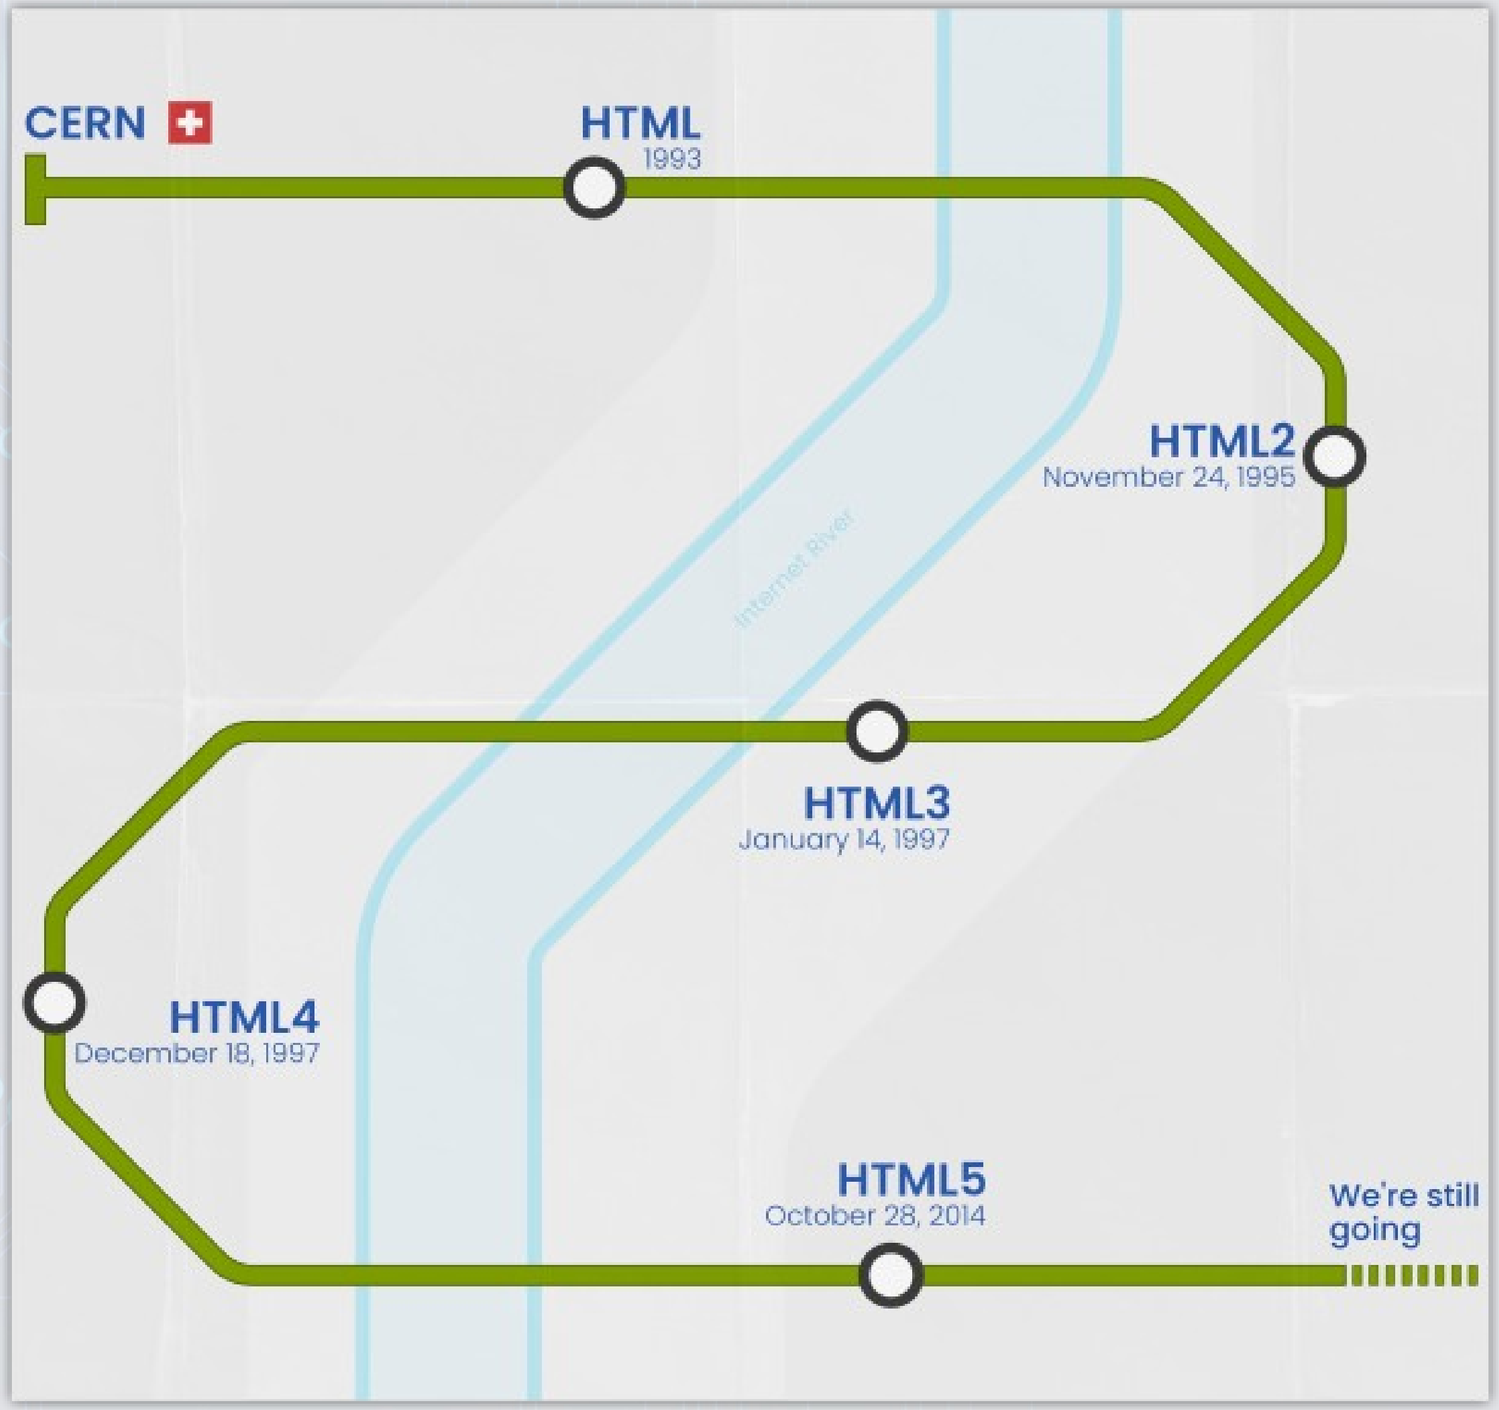

HTML EVOLUTION

- **HTML5 (2014)**

  HTML5 was a real game-changer! It introduced many new elements and features that make web development more powerful and versatile. With HTML5, we gained semantic elements for better structure, multimedia support for audio and video, and improved form handling.
- **HTML5.1 And Beyond**

  HTML5.1 and subsequent versions continue to refine and enhance HTML, focusing on performance, security, and providing more tools for building modern web applications.

HTML EVOLUTION SUMMARY

HTML STANDARDS

- The **World Wide Web Consortium**, or **W3C** for short, this organizations dedicated to maintaining HTML standards and ensuring a smooth web experience for everyone
- The other is the Web Hypertext Application Technology Working Group (WHATWG).

HTML STANDARDS

- The **W3C** and **WHATWG** are international communities of web experts who develop and **maintain** the **HTML standards**. They work collaboratively to propose, review, and refine the specifications through a rigorous process of discussions, testing, and consensus-building.
- They aim to establish and uphold HTML standards that keep the Internet running smoothly and advance the capabilities of web development.

HTML STANDARDS
