HTML FORMS | ACTIVITY PACK

Use Form Elements, Attributes, and Values in Designing Web Pages

Form Elements → Attributes → User Input

LEARNING OBJECTIVES

By the End of This Lesson, You Will...

01 **Identify** HTML form elements and their attributes.

02 **Create** forms with different input fields for collecting data.

03 **Apply** form attributes and values to build usable webpage forms.

TODAY'S ROADMAP

Form Elements → Attributes → User Input

Form Elements →

The building blocks: <form>, <input>, <label>, <textarea>, <select>, <button>.

Attributes →

Extra instructions in the opening tag: type, name, placeholder, required, and more.

User Input

Using elements and attributes together to collect information from visitors.

Basic Form Structure — <form>

A form starts with <form>. It uses action to say where the data goes and method to say how it's sent.

```
<form action="" method="post">
  <label>Name:</label>
  <input type="text" name="fullname">
  <input type="submit" value="Send">
</form>
```

TAG SUMMARY

<form>	Container for all form controls
<label>	Text caption for a form field
<input>	A single-line field (text, email, etc.)
<button>	A clickable button

Common Input Types

`type="text"`	Single line of plain text
`type="email"`	Checks for a valid email format
`type="password"`	Hides typed characters
`type="number"`	Accepts numbers only, with up/down arrows
`type="checkbox"`	A box that can be checked or unchecked
`type="radio"`	One choice from a group of options

Input Attributes & Values

`name`	Identifies the field's data when the form is submitted
`placeholder`	Shows light gray hint text inside an empty field
`required`	Field must be filled out before submitting
`value`	Sets a default or pre-filled value for the field
`maxlength`	Limits how many characters can be typed

```
<input type="email" name="email" placeholder="you@email.com" required>
```

Other Form Elements

Not all input is a single line. Use <textarea> for long text and <select> for a dropdown list.

```
<textarea rows="4" cols="30">
  Type your message here
</textarea>
```

Used for messages, comments, or feedback.

DROPDOWN LIST — <select>

```
<select name="grade">
  <option value="7">Grade 7</option>
  <option value="8">Grade 8</option>
</select>
```

<option> defines each choice inside the dropdown.

GREAT WORK, WEB DESIGNERS!

Forms collect input. Attributes and values make that input reliable.
